

Colon Cancer Survival Prediction

► Using Machine Learning Models

Presented by

Ligia Rodriguez

Data Sources

Data Source #	Name/ Short Description	Source URL	Type: - API - Web page - File	List of Fields	Format: - json - xml - csv - sql - other	Have tried to access/collect data with python? yes/no	Estimated data size, number of data points you plan to use
1	NIH Colorectal Cancer Clinical Trials	https://clinicaltrialsapi.cancer.gov/api/v2	API	Healthcare	json	Yes	300 or more
2	Colorectal Cancer Global Dataset	https://www.kaggle.com/datasets/ankushpanday2/colorectal-cancer-global-dataset-and-predictions/discussion	File	Healthcare	CSV	Yes	300 or more
3	Colorectal Cancer Dietary and Lifestyle Dataset – colon cancer risk factors	https://www.kaggle.com/datasets/ziya07/colorectal-cancer-dietary-and-lifestyle-dataset	File	Healthcare	CSV	Yes	300 or more
4	CDC Wonder	https://wonder.cdc.gov/wonder/help/wonder-api.html	Web	Healthcare	XML	Yes	300 or more

Introduction:

- This project explores how machine learning can be used to understand and predict colon cancer survival outcomes across different demographics. Colon cancer is increasingly being diagnosed in younger populations, challenging the long-held assumption that it primarily impacts older adults and making predictive modeling more critical than ever. By leveraging clinical trial intervention data from the NIH Cancer Clinical Trials API, mortality and survival statistics from CDC WONDER, a global colorectal cancer incidence dataset, and lifestyle risk factor dataset. This project aims to build models capable of predicting survival rates across age groups, genders, and countries and external factors. The goal is to demonstrate how combining clinical, epidemiological, and lifestyle data can uncover patterns that support earlier, more targeted interventions in colon cancer care.

Results Summary

- The linear regression model performed strongly, with predicted mortality rates closely matching actual values. The Random Forest model identified healthcare costs, tumor size, and age as the top predictors of survival, while lifestyle factors ranked lower in importance. Among the NIH clinical trials, immunotherapy had the highest number of trials with survival data (154), followed by chemotherapy (119) and targeted therapy (105). The classification model performed better at predicting survival (19,056 correct) than mortality (723 correct), reflecting a common challenge with imbalanced datasets. Lastly, country mortality rankings showed a near uniform average of approximately 17 per 100K across all 16 countries, highlighting colon cancer as a global burden.

Model Results : Linear Regression Survival Rankings

The background features three large, thin green circles. One circle is in the top-left corner, another is in the bottom-left corner, and a third, larger circle is on the right side of the slide.

Project Challenges

- API endpoints returned irrelevant data, requiring a switch to an alternative API source.
- HIPAA regulations limit access to individual patient data, restricting datasets to aggregated statistics.
- Medical data is fragmented, inconsistently formatted, and often contains suppressed values.
- Large CSV files demanded careful memory management and preprocessing before analysis.
- Class imbalance (survival cases far outnumbering deaths) hindered accurate mortality prediction.

The background features an abstract design with several thin green circles of varying sizes. Some circles are partially cut off by the edges of the frame. Scattered throughout are solid green circles of different diameters. A small green triangle points towards the top right in the upper right area.

Questions ?

The background is white with several green circles of varying sizes. A large, thin green circle is centered behind the text. To the left, a smaller green circle is partially visible. In the top right, a green play button icon is present. There are also several small green dots scattered around the main circle.
